## BOOK SYNOPSIS

This is a foundational book on homological algebra. It covers Ext and Tor early and without distraction, and includes several further topics, which can be pursued, independently of each other. Many of these, such as Lazard's theorem, long exact sequences in Abelian categories, or the relation between Krull dimension and global dimension, are hard to find elsewhere. The intended audience is mathematicians and graduate students in algebra, algebraic topology, or any other field that uses homological algebra.
